Section 3 - Pre-read and Content Updates

Section Introduction

In the real world, most of the front end applications are connected to a back end server or database. In this section, we are going to cover how to connect your application to a backend server.

Given that building a backend server is not the focus of this course, we will leverage a fake backend server, for you to practise on the skills of hooking up with the backend APIs.

Concepts to be covered

- Async/Await concept (Asynchronous Processing in JavaScript)
- Setting up fake backend server
- RESTful API
- Calling APIs using Axios

Pre-read

In this section, there are a few concepts that we need to understand before we actually start coding. Please make sure you watch the pre-lecture video and also the reading below:

- Pre-lecture video on Async/Await (The next learning material in the list)
- RESTful API ([Link](#))
